

Venting Aqua2go GD900 pump

When there is air in the membrane of the pump that needs to come out you can try as follow:

Garden hose on water inlet pressure gun:

- Connect a hose from a water tap on the water inlet of the pressure gun
- Turn the pressure gun on
- Turn the tap open so the water will push in the inlet with some pressure (Tap half open is enough).
- You will hear and see that the pump will start pumping the water and pressing the air out of the membrane of the pump inside the pressure gun. Now there is water inside the pump membrane. Place the supplied suction hose on the pressure gun and now it should work.
